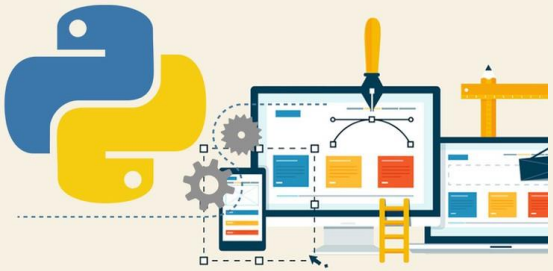
# getpass module

## (getpass() and getuser())



# Python Scripting for Automation

*(Automate your repetitive tasks with python scripting)*

**getpass()** prompts the user for a password without echoing. The getpass module provides a secure way to handle the password prompts where programs interact with the users via the terminal.

**getuser()** function displays the login name of the user. This function checks the environment variables LOGNAME, USER, LNAME and USERNAME, in order, and returns the value of the first non-empty string.

# Thank you
