

Concept: Inheritance and Polymorphism

Python Scripting for Automation

(Automate your repetitive tasks with python scripting)

Polymorphism:

- Polymorphism allows us to define same methods in different classes.
- This process is also known as Method Overriding.

Inheritance:

➤ Inheritance is a mechanism that allows us to create a new class – known as child class – that is based upon an existing class – the parent class.

➤ Advantage with inheritance:

➤ This saves you from duplicating a lot of code.

Thank you
