

For loop for string, list, tuple and dictionaries

Python Scripting for Automation

(Automate your repetitive tasks with python scripting)

Thank you

range() function:

- The range() function generates the integer numbers between the given start integer to the stop integer, which is generally used to iterate over with for Loop.
- Python3 range() accepts an integer and returns a range object, which is nothing but a sequence of integers.
- Syntax:
 - range (start, stop[, step])
 - range() takes three arguments.
 - Out of the three 2 arguments are optional. I.e., Start and Step are the optional arguments.
 - Default value of start is 0 and step is 1
