

platform module

(The platform module is used to access the underlying platform's data such as hardware, operating system and interpreter version info)

Python Scripting for Automation

(Automate your repetitive tasks with python scripting)

How to use platform module in a script ?

First import platform module using below syntax:

```
import platform  
or  
import platform as pt  
or  
from platform import *  
or  
from platform import system, platform
```

How to list all functions and variables of a platform module ?

There is a built-in function to list all the function names (or variable names) in a module and that is `dir()` function.

Then use `dir()` function as:

```
print(dir(platform))
```

How to get help of a platform module ?

From script: `print(help(platform))`

From Python command line: `help(platform)`

Thank you
