

Concept: destructor of a class

Python Scripting for Automation

(Automate your repetitive tasks with python scripting)

Constructor:

➤ A constructor is a special method that is called by default whenever you create an object from a class.

Destructor:

- Destructors are called when an object gets destroyed.
- In Python, destructors are not needed as much needed in C++ because Python has a garbage collector that handles memory management automatically.
- The `__del__()` method is known as a destructor method in Python. It is called when all references to the object have been deleted i.e when an object is garbage collected.

Thank you
