# Python range() function
(Python3 range() is a an object)

Python Scripting for Automation
(Automate your repetitive tasks with python scripting)

Thank you

range() function:

➤ The range() function generates the integer numbers between the given start integer to the stop integer, which is generally used to iterate over with for Loop.

➤ Python3 range() accepts an integer and returns a range object, which is nothing but a sequence of integers.

➤ <u>Syntax</u>:

➤ range (start, stop[, step])

➤ range() takes three arguments.

➤ Out of the three 2 arguments are optional. I.e., Start and Step are the optional arguments.

➤ Default value of start is 0 and step is 1
